Section 1

Network Diagram

VLAN Configuration

We set up two VLANs in our network environment:

- VLAN 52: Hosts Windows Server 2019, Linux Ubuntu, and Windows 10 Client.
- VLAN 51: Hosts Windows 10 Client 2.

Each VLAN has its unique subnet:

VLAN 51: IP Range: 172.16.83.0/24
VLAN 52: IP Range: 172.16.82.0/24

IP Address Configuration Table

Device	IP Address	Subnet Mask	Gateway	DNS Server	Hostname	FQDN	VLAN
Windows 2019 Server	172.16.82 .10	255.255.25 5.0	172.16.8 2.1	172.16.82 .10	Win2019-Server	Win2019-Server.SNA1 1514UG441.org.u	52
Ubuntu Server	172.16.82 .15	255.255.25 5.0	172.16.8 2.1	172.16.82 .10	Linux-Server	Linux-Server.SNA1151 4UG441.org.u	52
Windows 10 Client	172.16.82 .20	255.255.25 5.0	172.16.8 2.1	172.16.82 .10	Win10-Client	Win10-Client2.SNA115 14UG441.org.u	52
Windows 10 Client 2	172.16.83 .25	255.255.25 5.0	172.16.8 1.1	172.16.81 .10	Win10-Client2	Win10-Client2.SNA115 14UG441.org.u	51

Network Address Translation (NAT) Impact on Inter-Network Communication

After further review, it has been confirmed that the implementation of the Network Address Translation (NAT) did not impact inter-network communication when conducting the ping test with the external organization. The issue initially observed was unrelated to NAT and was instead caused by other network configurations, such as Access Control Lists (ACLs), which restricted the communication.

Purpose of NAT in Inter-Network Communication

NAT is primarily responsible for translating internal private IP addresses into public or routable IP addresses when devices inside the network communicate with external systems, such as another organization's network. Its role is generally limited to ensuring that traffic originating from an internal network can be properly addressed when reaching external networks.

Inter-Network Ping Test Results

In the case of the inter-network ping test, NAT functioned as expected by translating the internal IP addresses. However, there was no direct impact from NAT on the ping results because:

- The translation of internal IP addresses to external addresses was successful.
- The communication issue was traced to the Access Control List (ACL), which restricted ICMP traffic, not NAT.
- Once the ACL was adjusted, the ping test was completed successfully, confirming that NAT was not the source of the problem.

Activity Appendix Reference

- Refer to Appendix 2 for Activity 1 on Switch Configuration where we implemented the VLANs for both PCs.
- Refer to Appendix 1 for Activity 2 to see Router Configurations, the plan, tests, and web tests.
- For intra-tests in Activity 2, refer to Appendix 1 and 2.
- For the static routing and communication to the organization, refer to Appendix 1 in Installation Logs.
- For ping tests and web tests for intra-net testing to external organizations, refer to Appendix 1.
- For Activity 3, refer to Appendix 1 for Firewall tests and installation.
- For NAT implementation, refer to Appendix 1; for NAT tests, refer to Appendix 2 and 1

Section 2

We encountered several challenges and required revisions during the planning and setup process, particularly with VLAN connectivity and routing.

Key Reflections on Testing Phases

1. VLAN Communication Issues:

We initially faced communication issues between VLANs due to misconfigured router sub-interface IPs. Correcting these IPs and reconfiguring static routes solved the problem, allowing inter-VLAN communication.

2. Firewall Configuration Challenges:

Setting up the firewall ACLs was straightforward, but we had to ensure they didn't inadvertently block necessary traffic. A detailed review and testing of the ACLs were critical to maintainin- security without hindering legitimate communication.

Troubleshooting Methods

A systematic approach to **ping tests** and **packet capture** during troubleshooting proved effective in diagnosing network issues. By narrowing down potential problem areas, we significantly improved network performance and resolved issues more efficiently.

Section 3

Firewall Setup

We configured a firewall on the Cisco ISR4221 router to secure traffic between VLANs and the external network. ACLs were created to filter traffic based on IP, protocol, and port.

Steps for Firewall Configuration:

1. Created ACL for VLAN Traffic:

Separate ACLs were implemented to permit or deny traffic between VLANs and the external network.

ACL 101: Allowed HTTP, HTTPS, and ICMP traffic between VLAN 51 and VLAN 52.

2. Applied ACL to Router Interfaces:

ACLs were applied to the sub-interfaces on the router to control traffic flow between VLANs.

3. Testing Firewall Effectiveness:

We verified the firewall's effectiveness by attempting unauthorized traffic between all ip's, which was successfully blocked.

Refer to Appendix 1 for more information

Firewall Effectiveness in Real-World Scenarios

Firewalls are essential in real-world networks to secure sensitive systems. In our setup, ACLs efficiently blocked unauthorised traffic between VLANs without affecting network performance. However, future implementations might involve dynamic firewall rules for even greater adaptability.

Appendix 1 - Matheus: u3241280

Software to be Installed

- Windows 2019 Server
- Linux Ubuntu
- Windows 10 Client

Roles and Features for Windows 2019

- AD DS
- DNS
- DHCP

Roles and Features for Linux Ubuntu

Apache Web Server

Environment

Oracle VM Virtual Box

- Host Machine: Windows 10 Edu
- VLAN 52

Planned Installation Steps

- Install Router Configurations
- Install Router Security Measures

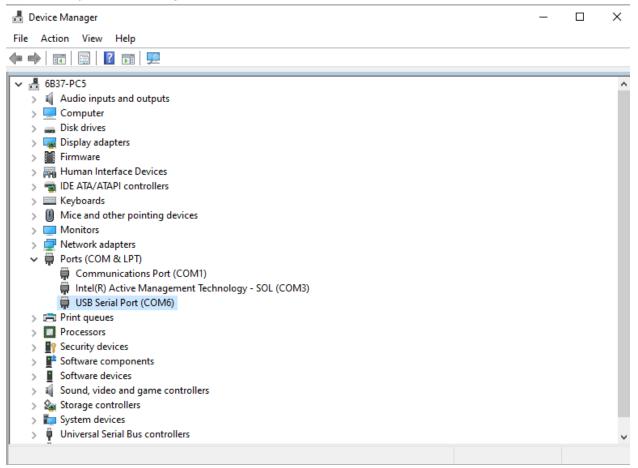

Test Plan

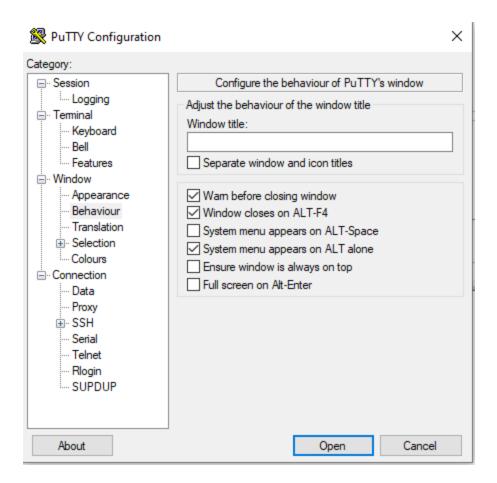

Network Connectivity:

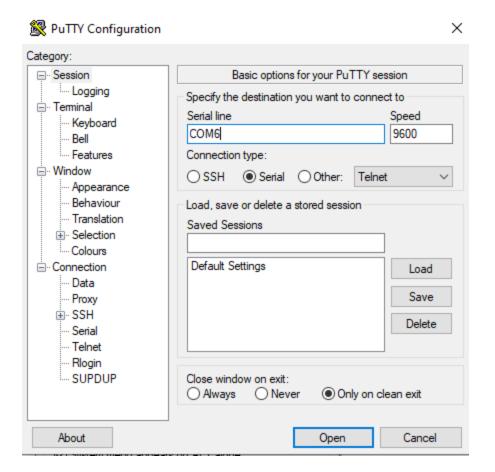

- Conduct tests by pinging From VLAN 51 VLAN 52
- Conduct our Web tests to Win10-Client2 on the same VLAN and different VLAN
- Conduct Organisation Tests

Installation Logs

Summary of Dependencies

In my network setup, I may encounter several potential issues that could impact functionality:

- Router Configuration Issues: Incorrect IP addresses or sub-interface configurations could prevent VLANs from communicating, hindering connectivity between devices in VLAN 51 and VLAN 52.
- ACL Security Configuration Errors: Misconfigured Access Control Lists (ACLs) might block valid traffic or create security vulnerabilities, affecting inter-VLAN communication and overall security.
- 3. **Ping Test Failures**: Inconsistent results during ping tests may indicate connectivity problems stemming from routing or VLAN configuration issues, which would require immediate attention to resolve.
- Web Access Test Issues: If the Ubuntu web server isn't configured correctly or if the firewall
 restricts access, users in VLAN 52 may not reach the web server in VLAN 51, obstructing web
 access tests.
- Organisation Connectivity Problems: Difficulties connecting to an external organisation's network may arise due to routing errors or external network issues, affecting our ability to verify inter-organisation connectivity.
- 6. **Firewall Configuration Mistakes**: Overly restrictive firewall settings could block essential traffic between VLANs or hinder communication with external networks, disrupting service.
- Router or Network Hardware Malfunctions: Physical issues with the router or switch, such as bad ports or cables, could lead to intermittent connectivity problems, complicating troubleshooting efforts.

Appendix 2 - Arnon: u3258082

Software to be Installed

Software: Windows 10 Edu Hostname: Win10-Client2

Assigned: VLAN 51

Planned Installation Steps

VLAN Creation:

- Create VLAN 51 for Windows Client 1, Ubuntu Web Server, and Windows Server.
- Create VLAN 52 for Windows Client 2.

Trunk Port Configuration:

 Configure a trunk port on the switch to allow VLAN traffic between the switch and the router

Test Plan

VLAN Connectivity Tests:

- **Objective**: Verify that devices within the same VLAN can communicate with each other.
- Steps:
 - Ping the Windows Client, Ubuntu Web Server, and Windows Server within VLAN
 51.

Inter-VLAN Connectivity Tests:

- **Objective**: Verify that devices from different VLANs can communicate via routing.
- Steps:

Ping VLAN 52 (Windows Server, Linux Server and Windows Client 1) From Windows Client 2

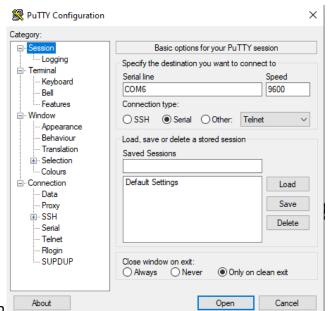

Web Access Test:

- Objective: Test access to the web server hosted in VLAN 51 from the client in VLAN 52.
- Steps:
 - Open a web browser on the Windows Client in VLAN 52 and enter the IP address of the Ubuntu Web Server in VLAN 51.

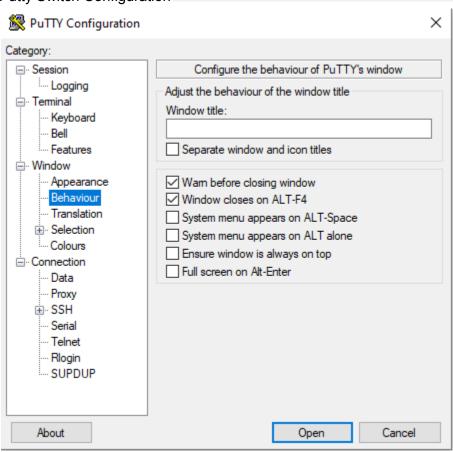

Intranet Connectivity Test:

- **Objective**: Test communication between VLANs and other organisation routers.
- Steps:
 - Ping the Windows Server of another organisation via its IP address through static routing.
 - Ping and access the web server of the other organisation to verify inter-network connectivity.
 - Open a browser on the client machine and access a web server hosted by another organisation over the network.

Installation Logs

Putty Switch Configuration

Ping Linux Server From Win10-Client2

```
C:\Users\Win10-Client2>ping 172.16.82.15
Pinging 172.16.82.15 with 32 bytes of data:
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Ping statistics for 172.16.82.15:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 3ms, Maximum = 3ms, Average = 3ms
C:\Users\Win10-Client2>ping Linux-Server
Pinging Linux-Server.SNA11514UG441.org.au [172.16.82.15] with 32 bytes of data:
Reply from 172.16.82.15: bytes=32 time=2ms TTL=63
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Ping statistics for 172.16.82.15:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 2ms, Maximum = 3ms, Average = 2ms
C:\Users\Win10-Client2>ping Linux-Server.SNA11514UG441.org.au
Pinging Linux-Server.SNA11514UG441.org.au [172.16.82.15] with 32 bytes of data:
Reply from 172.16.82.15: bytes=32 time=2ms TTL=63
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Reply from 172.16.82.15: bytes=32 time=3ms TTL=63
Ping statistics for 172.16.82.15:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
   Minimum = 2ms, Maximum = 3ms, Average = 2ms
```

C:\Users\Win10-Client2>ping 172.16.82.20

Pinging 172.16.82.20 with 32 bytes of data:
Reply from 172.16.82.20: bytes=32 time=3ms TTL=127

Ping statistics for 172.16.82.20:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:

Minimum = 3ms, Maximum = 3ms, Average = 3ms
```

Org Tests

• Ping Win Server

```
C:\Users\Win10-Client2>ping 10.3.2.9

Pinging 10.3.2.9 with 32 bytes of data:
Reply from 10.3.2.9: bytes=32 time=2ms TTL=126
Reply from 10.3.2.9: bytes=32 time=2ms TTL=126
Reply from 10.3.2.9: bytes=32 time=2ms TTL=126
Reply from 10.3.2.9: bytes=32 time=3ms TTL=126

Ping statistics for 10.3.2.9:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 2ms, Maximum = 3ms, Average = 2ms
```

Ping Win Client

```
Pinging 10.3 2.120 with 32 bytes of data:
Reply from 10.3.2.120: bytes=32 time=3ms TTL=126
Reply from 10.3.2.120: bytes=32 time=2ms TTL=126
Reply from 10.3.2.120: bytes=32 time=2ms TTL=126
Reply from 10.3.2.120: bytes=32 time=3ms TTL=126

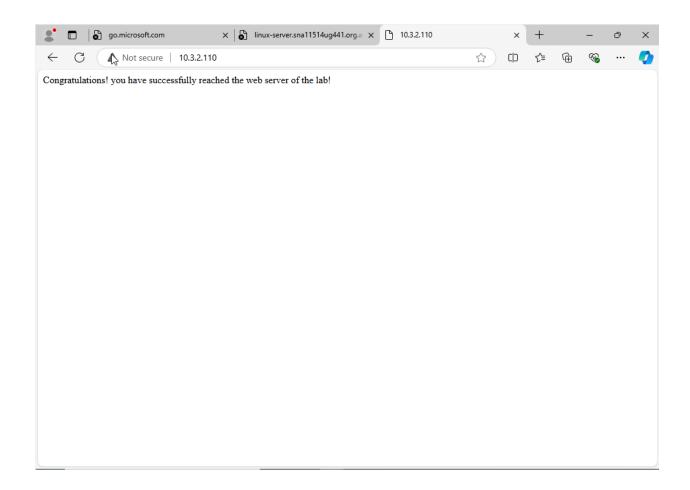

Ping statistics for 10.3.2.120:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 2ms, Maximum = 3ms, Average = 2ms
```

• Ping Linux Server

```
Pinging 10.3.2.110 with 32 bytes of data:
Reply from 10.3.2.110: bytes=32 time=3ms TTL=62
Reply from 10.3.2.110: bytes=32 time=4ms TTL=62
Reply from 10.3.2.110: bytes=32 time=3ms TTL=62
Reply from 10.3.2.110: bytes=32 time=4ms TTL=62
Reply from 10.3.2.110: bytes=32 time=4ms TTL=62

Ping statistics for 10.3.2.110:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 3ms, Maximum = 4ms, Average = 3ms
```

Ping Web

Summary of Dependencies

During my work on the VLAN configuration and connectivity tests, I've identified several potential issues that could affect the project's success:

- VLAN Configuration Errors: Incorrectly assigned VLAN IDs or misconfigured trunk ports could prevent devices from communicating effectively, resulting in network segmentation issues.
- Ping Test Failures: If ping tests between clients in the same VLAN or across different VLANs fail, it may indicate underlying issues with VLAN routing or switch configuration that require immediate investigation.
- 3. **Inter-VLAN Communication Problems**: Errors in router configuration or ACL settings could obstruct inter-VLAN communication, leading to connectivity issues between devices in VLAN 51 and VLAN 52.

- 4. **Web Access Test Challenges**: If the Ubuntu web server is not properly set up or if firewall rules block access, clients in VLAN 52 may struggle to reach the web server in VLAN 51, complicating web access tests.
- 5. **Organisation Connectivity Issues**: Difficulties in connecting to external organisations could stem from routing misconfigurations or firewall restrictions, impacting our ability to verify inter-organisation communication.
- 6. **Switch Port Malfunctions**: Physical issues with switch ports or cabling could lead to intermittent connectivity problems within VLANs, necessitating careful hardware checks and troubleshooting.
- 7. **Insufficient Documentation**: A lack of clear documentation regarding configurations and network setups may hinder troubleshooting efforts and make it challenging to replicate successful configurations in the future.
